Demo video captions & shot list

A 60-second walkthrough: group size, three preferences, one answer, the live seat map and Ask AI.

Video description (paste under the upload)

Campus Pulse answers the only question that matters at lunch: where do I actually go? Tell it how many of you there are and what you care about — closest, quietest, no queue, or all three — and it names one place, with live free seats, queue wait and walking time. Tap through for the seat map, ghost seats and the rest of campus. Ask it anything in plain language, including why it chose that place. The camera counts seats and throws the frame away; no video ever reaches the browser. Just the answer.

Built with Python, OpenCV and a pre-trained YOLO11 model. Live demo: localhost:3000

On-screen captions, in shot order

0:00	**Campus Pulse finds you a seat before you start walking.**	Landing wordmark
0:06	**One to eight people. Tell it the size of your group.**	Seat numbers 1–8
0:11	**Closest, quietest, no queue — pick one, two, or all three.**	Multi-select chips
0:17	**One answer, not a directory: the place to go right now.**	Huge venue name
0:23	**Live seats free, queue wait and walk time.**	Three big numbers
0:29	**See the room before you walk in: free, taken, held and abandoned.**	Seat map + legend
0:36	**One tap unfolds every other free seat on campus.**	Arrow expander
0:42	**Everything else hides behind the three-line menu.**	Hamburger opens
0:46	**Student view, staff view — the same live data.**	Student / Staff switch
0:50	**Ask in plain language: seats together, queues, quietest time, or why this pick.**	Ask AI reply
0:55	**Cameras count seats, never people.**	Privacy line + close

Campus Pulse — live seats, queues and calm.

Feature captions

Short lines for cards, lower-thirds or voiceover.

01 Landing
Campus Pulse: live seats, live queues, one calm decision.

02 Group size
From one to eight — it finds a table that actually fits everyone.

03 Preferences
Closest, quietest, no queue. Choose any combination, not just one.

04 The answer
One place, named in huge type, with the reason in a single line.

05 Live numbers
Free seats, queue wait and walk time, straight from the live engine.

06 Seat map
See the room before you walk in: free, taken, held and abandoned seats.

07 More seats
One small arrow opens every other free seat on campus right now.

08 Menu
Map, alerts, staff view and demo controls — behind three quiet lines.

09 Student / Staff
The same live data, explained for students or for the canteen team.

10 Ask AI
Ask for seats together, the shortest queue, or why it picked this place.

11 Privacy
The camera counts seats and discards the frame. No faces, no footage.

12 Close
Campus Pulse: less hunting, more lunch.

How to film it

- Keep it under 60 seconds. The landing wordmark needs a beat to assemble — do not rush it.
- Record at 1440 px wide or more. The type is the product, so let it fill the frame.
- Show the chip count changing: one chip, then three chips, then the answer. That is the feature.
- Open the arrow and scroll once, slowly. The list is the proof of depth.
- End on the Ask AI answer, then tap “Ask why”. That is the moment judges remember.

Honest note for the description

Live camera accuracy was measured on a public eatery camera: the model draws real boxes but undercounts a wide, dim, crowded room (about 19% recall with yolo11n at 640, about 58% with yolo11s at 960). At table distance — the setup this demo uses — people are large in frame. **Full method and numbers: docs/LIVE_FEED_CHECK.md.**
